

Sample Software Quality Review

This sample report is for format preview only. It uses a fictional startup scenario and does not contain custom recommendations for any real business or product.

Sample Scenario

A startup is preparing to launch a SaaS MVP with user onboarding, dashboard access, email notifications, and a subscription flow. The founder wants an independent quality review before public launch.

Executive Summary

The product appears close to launch, but several quality risks should be reviewed before go-live. The most important areas are onboarding reliability, payment edge cases, mobile layout, notification consistency, and regression coverage for critical flows.

Risk Snapshot

Area	Risk Level	Notes
Onboarding	Medium	Several account states should be tested before launch.
Payment flow	High	Test success, failure, cancelled payment, and retry scenarios.
Mobile layout	Medium	Responsive checks required for small screens and tablets.
Email notifications	Medium	Verify timing, content, and delivery states.

Recommended Next Steps

- Run end-to-end tests on the most important user journeys before launch.
- Create a release readiness checklist covering onboarding, billing, dashboard access, and email notifications.
- Document known issues and decide which ones block launch.
- Review regression coverage so future changes do not break existing flows.
- Prepare a simple go/no-go summary before public release.

Example Deliverables in a Paid Engagement

Deliverable	Purpose
Quality risk summary	Clarifies the main product and release risks.
Test scenarios	Defines what should be tested and why.
Bug report	Documents issues with clear reproduction steps and severity.
Release readiness notes	Supports a practical go/no-go decision.

Disclaimer

This sample is for demonstration only. Custom analysis, recommendations, and product-specific review require a paid engagement with agreed scope and access.
